

# 3D seismic survey design – Second edition

## Contents

About the Author	xi
Foreword to the Second Edition	xiii
Foreword to the First Edition	xv
Acknowledgments to the Second Edition	xvii
Acknowledgments to the First Edition	xix
Introduction	xxi

## Chapter 1 2D symmetric sampling 1

1.1 Introduction	1
1.2 Shot/receiver and midpoint/offset coordinate systems in two dimensions	1
1.3 Symmetric sampling	4
1.4 Symmetric sampling versus asymmetric sampling	9
1.5 The total stack response	11
1.6 Concluding remarks	13

## Chapter 2 3D acquisition geometries, their properties, and their sampling 15

2.1 Introduction	15
2.2 Classes of 3D geometries	16
2.2.1 Examples of various geometries	16
2.3 The continuous wavefield	19
2.3.1 The shot/receiver and midpoint/offset coordinate systems	19
2.3.2 3D subsets of the 5D wavefield	19
2.3.2.1 The midpoint line	
2.3.2.2 The 3D shot	
2.3.2.3 The cross-spread	
2.3.2.4 The slanted spread and the zig-spread	
2.3.2.5 The COV gather	
2.3.2.6 The 3D midpoint	
2.3.3 3D subsets and acquisition geometry	23
2.3.3.1 Traveltime contours of 3D subsets	
2.3.3.2 Fold of basic subsets	
2.3.3.3 Extent of basic subsets	
2.3.3.4 Minimal data sets	
2.3.3.5 The cross-spread as subset of orthogonal geometry	
2.3.3.6 Subsets of zigzag geometry	
2.3.4 Fold in 3D seismic data	28
2.3.4.1 Unit cell	
2.3.4.2 Fold-of-coverage	
2.3.4.3 Illumination fold	
2.3.4.4 Image fold	
2.4 Sampling the continuous wavefield	31
2.4.1 Binning	31
2.4.2 Sampling and the unit cell	32
2.4.3 Aspect ratios	33
2.4.4 Spatial continuity	34
2.4.5 3D symmetric sampling	34

- 2.4.6 Line geometries 35
  - 2.4.6.1 Parallel geometry
  - 2.4.6.2 Orthogonal geometry
  - 2.4.6.3 Zigzag geometry
- 2.4.7 Areal geometry 40
- 2.5 Pseudo-COV gathers 41
  - 2.5.1 Introduction 41
  - 2.5.2 Offset-vector tiles 41
  - 2.5.3 Construction of pseudo-COV gathers 42
  - 2.5.4 Example of OVTs in 64-fold regular geometry 44
  - 2.5.5 Reciprocal OVTs 45
  - 2.5.6 A measure of spatial discontinuity 46
  - 2.5.7 A plethora of OVT gathers 47
- 2.6 Application to prestack processing 47
  - 2.6.1 Introduction 47
  - 2.6.2 Noise removal 48
  - 2.6.3 Interpolation and regularization 50
  - 2.6.4 Muting 51
  - 2.6.5 First-break picking 51
  - 2.6.6 Nearest-neighbor correlations 52
  - 2.6.7 Residual statics 52
  - 2.6.8 Velocity analysis 52
  - 2.6.9 Multiple suppression 54
  - 2.6.10 Amplitude variation with offset 55
    - 2.6.10.1 Nears, mids, and fars
    - 2.6.10.2 AVO measurement in bins or in unit cells
  - 2.6.11 Amplitude variation with azimuth 57
- 2.7 Conclusions 57

## **Chapter 3 Noise suppression 59**

- 3.1 Introduction 59
- 3.2 Properties of low-velocity noise 59
  - 3.2.1 Direct waves 59
  - 3.2.2 Scattered waves 59
    - 3.2.2.1 Point scatterer
    - 3.2.2.2 Line scatterer
- 3.3 Shot and receiver arrays in 3D data acquisition 65
  - 3.3.1 Introduction 65
  - 3.3.2 Effect of linear array on noise 65
  - 3.3.3 Effect of linear array on signal 68
    - 3.3.3.1 Introduction
    - 3.3.3.2 Intra-array statics
    - 3.3.3.3 Length of array
    - 3.3.3.4 Azimuthal effect
  - 3.3.4 Direct wave noise suppression 70
  - 3.3.5 Scattered-wave noise suppression 71
  - 3.3.6 Analysis of various array combinations 72
  - 3.3.7 Discussion 76
- 3.4 Stack responses 77
  - 3.4.1 Introduction 77
  - 3.4.2 The 2D stack response 77
  - 3.4.3 Multiple suppression by stacking 77

- 3.4.3.1 Multiples with small differential moveout
- 3.4.3.2 Multiples with large differential moveout
- 3.4.4 3D stack responses 80
- 3.4.5 Discussion 84

## **Chapter 4 Guidelines for design of 3D geometry on land 87**

- 4.1 Introduction 87
  - 4.1.1 Spatial continuity 87
  - 4.1.2 Regular geometry 88
  - 4.1.3 Geophysical requirements/constraints 88
  - 4.1.4 General recipe for 3D survey design 88
- 4.2 Preparations 89
  - 4.2.1 Objective of survey 89
  - 4.2.2 Know your problem 89
- 4.3 The choice of geometry 90
  - 4.3.1 Parallel geometry versus orthogonal geometry 90
  - 4.3.2 Zigzag geometry versus orthogonal geometry 91
  - 4.3.3 Slanted geometry versus orthogonal geometry 92
  - 4.3.4 Comparison of sampled minimal data sets of crossed-array geometries 92
  - 4.3.5 Areal geometry 92
  - 4.3.6 Hybrid geometry 94
  - 4.3.7 Target-oriented geometries 95
- 4.4 Selecting the main geometry parameters 96
  - 4.4.1 Establish representative velocity function 96
  - 4.4.2 Identify main targets 96
  - 4.4.3 Resolution requirements and maximum frequency 96
  - 4.4.4 Establish maximum dip angle in each target 99
  - 4.4.5 Establish spatial sampling intervals 99
    - 4.4.5.1 Various spatial sampling intervals
    - 4.4.5.2 Single-point acquisition versus array-based acquisition
    - 4.4.5.3 Event-oriented sampling intervals
    - 4.4.5.4 Statics and spatial sampling
    - 4.4.5.5 Noise suppression and sampling
    - 4.4.5.6 Discussion on spatial sampling
  - 4.4.6 Establish maximum stretch factor and mute function 104
    - 4.4.6.1 The NMO stretch factor
    - 4.4.6.2 The maximum stretch factor and the mute function
    - 4.4.6.3 Average stretch factor
    - 4.4.6.4 AVO and maximum stretch factor
  - 4.4.7 Establish required fold in each target 107
    - 4.4.7.1 Fold as a dependent or independent parameter
    - 4.4.7.2 Average fold
    - 4.4.7.3 How to determine desired or required fold
  - 4.4.8 Determine line intervals 110
  - 4.4.9 Determine maximum offset 111
  - 4.4.10 Other geometry parameters 112
  - 4.4.11 Harmonizing all requirements 112
- 4.5 Implementing the nominal geometry 113
  - 4.5.1 Zippers 114
  - 4.5.2 Templates 114
    - 4.5.2.1 One-line roll
    - 4.5.2.2 Sources outside template

- 4.5.2.3 Full-swath roll
- 4.5.2.4 Multi-line roll with extra receiver lines
- 4.5.2.5 Superspread
- 4.5.2.6 Multiline roll without extra receiver lines
- 4.5.3 The survey grid and the survey area 121
  - 4.5.3.1 Determine migration distance
  - 4.5.3.2 Determine radius of zone of influence
- 4.5.4 Dealing with obstacles 123
- 4.5.5 Source selection 127
  - 4.5.5.1 Source types
  - 4.5.5.2 Source strength
  - 4.5.5.3 The need for low frequencies
  - 4.5.5.4 Use of different sources in one survey
  - 4.5.5.5 Simultaneous sources
- 4.6 Testing 133
- 4.7 Discussion 134
  - 4.7.1 Attribute analysis 134
  - 4.7.2 Model-based survey design 134
  - 4.7.3 Acquisition footprint 140
  - 4.7.4 Random sampling 140
- 4.8 What to do and not to do in 3D survey design 141

## **Chapter 5 Marine seismic data acquisition 143**

- 5.1 Introduction 143
  - 5.1.1 Air-gun arrays 144
- 5.2 Geometry imprint 144
- 5.3 Streamer acquisition 146
  - 5.3.1 Introduction 146
  - 5.3.2 Multisource multistreamer configurations 146
  - 5.3.3 Crossline-offset variation 147
  - 5.3.4 Source interval, number of sources, and fold 149
  - 5.3.5 Inline bin size and crossline bin size 149
  - 5.3.6 Offset-vector-tile gathers in streamer acquisition 150
  - 5.3.7 Effects of spatial discontinuity in marine streamer acquisition 151
    - 5.3.7.1 Illumination effects
    - 5.3.7.2 Azimuthal anisotropy
    - 5.3.7.3 Reducing spatial discontinuities
    - 5.3.7.4 Infill shooting
    - 5.3.7.5 Undershooting
  - 5.3.8 Maximum offset 160
  - 5.3.9 Depth of sources and streamers 161
    - 5.3.9.1 Cable noise
    - 5.3.9.2 Ghost effect
    - 5.3.9.3 Absorption
  - 5.3.10 Over/under technique 164
  - 5.3.11 Multicomponent streamer 164
    - 5.3.11.1 Dual-sensor streamer
    - 5.3.11.2 Quad-sensor streamer
  - 5.3.12 Variable-depth streamer 167
  - 5.3.13 Shooting direction 167
    - 5.3.13.1 Dip/strike decision
  - 5.3.14 Multiazimuth acquisition 169

- 5.3.15 Wide-azimuth acquisition 172
  - 5.3.15.1 Introduction
  - 5.3.15.2 Characteristics of wide-azimuth towed streamer acquisition
  - 5.3.15.3 Parallel or areal geometry?
  - 5.3.15.4 Compromises in areal WATS
    - Binsize
    - Number of sources
    - Crossline roll
    - Number of boat passes required for each source track
    - Maximum offset
    - Edge effects
    - Feathering aspects
    - Summary
  - 5.3.15.5 Other areal WATS configurations
  - 5.3.15.6 Simultaneous sources helpful for areal WATS?
  - 5.3.15.7 Rich azimuth (RAZ)
  - 5.3.15.8 Coil shooting
  - 5.3.15.9 Zigzag WATS
- 5.3.16 Operational aspects 186
- 5.4 Stationary-receiver techniques 187
  - 5.4.1 Introduction 187
  - 5.4.2 Some history 188
    - 5.4.2.1 Vertical hydrophone cable (VHC)
    - 5.4.3.2 SUMIC
  - 5.4.3 Source array 189
  - 5.4.4 Coupling issues 189
  - 5.4.5 Noise at the sea bottom 189
  - 5.4.6 Dual-sensor application 190
  - 5.4.7 OBC 191
    - 5.4.7.1 Implementation aspects
    - 5.4.7.2 Geometries for OBC acquisition
    - 5.4.7.3 OBC acquisition with buried cables
  - 5.4.8 Ocean-bottom seismometers 195
  - 5.4.9 Transition-zone acquisition 197
- 5.5 Time interval between shots and source strength 198
- 5.6 Time-lapse acquisition 198
  - 5.6.1 Introduction and objective 198
  - 5.6.2 Measures of nonrepeatability 199
  - 5.6.3 Causes of nonrepeatability 201
  - 5.6.4 Ways to improve repeatability 202
- 5.7 Discussion 204

## **Chapter 6 Converted waves: Properties and 3D survey design 207**

- 6.1 Introduction 207
- 6.2 Properties of the PS-wavefield 208
  - 6.2.1 Traveltime surfaces and apparent velocity 208
  - 6.2.2 Illumination 209
  - 6.2.3 Imaging 210
  - 6.2.4 Resolution 212
  - 6.2.5 NMO stretch in PS-waves 218
  - 6.2.6 Shear-wave splitting 218
- 6.3 3D survey design for PS-waves 219

- 6.3.1 Choice of geometry 219
  - 6.3.1.1 Orthogonal geometry
  - 6.3.1.2 Parallel geometry
  - 6.3.1.3 Areal geometry
  - 6.3.1.4 Parallel versus orthogonal geometry and areal geometry
- 6.3.2 Sampling 225
- 6.4 Processing considerations 225
- 6.5 Conclusions and recommendations 226

## **Chapter 7 Some lowfold data examples 229**

- 7.1 Introduction 229
- 7.2 3D microspread 229
  - 7.2.1 Introduction 229
  - 7.2.2 Acquisition parameters of 3D microspread 229
  - 7.2.3 Cross sections and time slices 229
  - 7.2.4  $f$ - $k$  filtering results 231
  - 7.2.5 Discussion 232
- 7.3 Nigeria 3D test geometry results 234
  - 7.3.1 Introduction 234
  - 7.3.2 Acquisition geometry 235
  - 7.3.3 Some processing results 238
  - 7.3.4 Interpretation results 238
  - 7.3.5 Discussion 238
- 7.4 Prestack migration of lowfold data 241
  - 7.4.1 Introduction 241
  - 7.4.2 Migration of a single cross-spread 242
  - 7.4.3 Lowfold prestack migration 243
  - 7.4.4 More lowfold migration results 244
  - 7.4.5 Discussion 246

## **Chapter 8 Factors affecting spatial resolution 247**

- 8.1 Introduction 247
- 8.2 Spatial resolution formulas 248
  - 8.2.1 Spatial resolution — The link with migration/inversion 248
  - 8.2.2 Spatial resolution formulas for constant velocity 249
- 8.3 Spatial resolution measurements 251
  - 8.3.1 Procedure for resolution analysis 251
  - 8.3.2 2D resolution in the zero-offset model 252
  - 8.3.3 2D resolution in the offset model 253
  - 8.3.4 Asymmetric aperture 254
  - 8.3.5 3D spatial resolution 255
  - 8.3.6 Sampling and spatial resolution 257
  - 8.3.7 Sampling and migration noise 257
  - 8.3.8 Bin fractionation 258
  - 8.3.9 Fold and spatial resolution 259
- 8.4 Discussion 260
- 8.5 Conclusions 261

## **Chapter 9 DMO 263**

- 9.1 Introduction 263
- 9.2 DMO in arbitrary 3D acquisition geometries 264

- 9.2.1 The time of a DMO-corrected event 264
- 9.2.2 Contributing traces in cross-spread 265
- 9.2.3 DMO-corrected time in the cross-spread 266
- 9.2.4 Extension to other geometries 266
- 9.3 Results with synthetic data 267
- 9.4 New DMO programs 268
- 9.5 DMO in OVT gathers 269
- 9.6 Conclusion 269

## **Chapter 10 Prestack migration 271**

- 10.1 Introduction 271
- 10.2 Migration basics 271
  - 10.2.1 The purpose of migration 271
  - 10.2.2 Migration as a two-step process 273
- 10.3 Fresnel zone and zone of influence 275
  - 10.3.1 Modeling 275
  - 10.3.2 Migration 275
- 10.4 Experiments with synthetic data 278
  - 10.4.1 Description of model experiments 278
  - 10.4.2 Prestack migration with minimal data sets 278
  - 10.4.3 Prestack migration with pseudo-COV gathers 280
    - 10.4.3.1 Parallel geometry
    - 10.4.3.2 Orthogonal geometry
    - 10.4.3.3 Intermezzo: Imaging test with singlefold gathers
    - 10.4.3.4 Illumination and imaging in orthogonal geometry
    - 10.4.3.5 Areal geometry
    - 10.4.3.6 Irregular geometries
- 10.5 Discussion 290

## **Appendix A Sampling and aliasing 293**

## **Appendix B Aperture for sampled wavefields 297**

- B.1 Introduction 297
- B.2 Continuous aperture function 297
- B.3 Discrete aperture function 297
- B.4 Conclusions 299

## **Appendix C Useful formulas in 3D seismic survey design 301**

- C.1 Introduction 301
- C.2 Algorithm for average\_fold 302

## **Appendix D Fold requirement of 3D survey 303**

## **Appendix E Nomenclature 307**

## **References 311**

## **Index 333**
